Abstract: *Seaports play an important role in efforts to reduce greenhouse gases and global warming for two reasons: they are usually located close to large population centres, and on the other hand, they have a high concentration of ships. With the continued expansion of world trade, these ports are under increasing pressure to combine their economic growth with environmental protection, and the main strategic path to this is to build more sustainable systems and gradually transition to so-called "green ports". Such ports are no longer some imaginary illusions; they are an urgent necessity for decarbonization and industrial sustainability.*

This study aims to examine key strategies for transition to green ports and to indicate the main paths for transforming of conventional seaports into such green zones of sustainable development.

Keywords:*green ports; sustainable port development; decarbonization; emissions reduction; port resilience.*

This paper is awarded with the “Best Paper Crystal Prize” and will be published in the compiled proceedings “Best Papers of the 64-th Science Conference of the University of Ruse”.
